Event Gateway

Fictional specification authored for the Spec Review reference project.

1. Event ingestion

The gateway accepts JSON events over HTTPS.

Each request may contain up to 100 events.

The maximum request body is 1 MiB.

A successful response means the event has entered durable storage.

Clients retry failed requests using an idempotency key.

Event Gateway

Fictional specification authored for the Spec Review reference project.

2. Delivery and retention

Delivery uses at-least-once semantics.

Idempotency keys remain valid for 24 hours.

Consumers must tolerate duplicate delivery.

Events are retained for 7 days.

Consumers can replay events within the retention period.

Fictional specification authored for the Spec Review reference project.

3. Operations

The service reports queue depth and oldest-event age.

Retries use a fixed delay of 5 seconds.

Health checks report liveness and readiness separately.

The legacy status endpoint is /v1/status.

All limits apply per deployment.
